

Placement Simulator - Interview Report

Role: Engineer

Category: dsa

Difficulty: easy

Scores

overall: 45/100

technical: 45/100

communication: 50/100

confidence: 35/100

problemSolving: 40/100

coding: 0/100

Strengths

- Demonstrated correct preprocessing steps for palindrome checking (case normalization and removal of non alphanumeric characters).
- Attempted to address the balanced parentheses problem, showing awareness of the need to compare opening and closing brackets.

Weaknesses

- Incorrect or incomplete algorithm for balanced parentheses (counting alone is insufficient).
- Unable to answer the two sum problem and provide time/space complexity.
- Low confidence and vague statements throughout the interview.
- Missing explanation of trade offs or alternative approaches.

Suggestions

- Practice stack based solutions for parentheses validation to understand nesting.
- Review the classic two sum problem, including hash map implementation and complexity analysis.
- Work on articulating solutions more confidently, using clear structure and justification.
- Include edge case handling and complexity reasoning in future answers.

Summary

The candidate shows basic familiarity with string manipulation for palindrome detection but lacks depth in algorithmic reasoning for parentheses validation and fails to solve a classic array problem. Confidence and completeness are low, suggesting a need for focused practice on data structure fundamentals and clear communication.
