

Placement Simulator - Interview Report

Role: Engineer

Category: dsa

Difficulty: easy

Scores

overall: 55/100

technical: 45/100

communication: 52/100

confidence: 50/100

problemSolving: 55/100

coding: 0/100

Strengths

- Provided a correct brute force algorithm for finding two numbers that sum to a target, including accurate time and space complexity analysis.
- Clearly described a brute force approach for checking balanced parentheses, demonstrating the ability to articulate algorithmic steps.

Weaknesses

- Unable to answer the first non repeating character question, indicating a gap in knowledge of hash map usage for string problems.
- The parentheses solution omitted the standard stack approach and did not discuss time/space complexity, showing incomplete problem solving depth.
- Overall responses lacked consistency in confidence and completeness.

Suggestions

- Practice common string manipulation problems, especially those involving hash maps, to build confidence and completeness.
- Study the stack based algorithm for balanced parentheses and practice explaining its complexity and edge cases.
- Work on maintaining a consistent level of confidence and thoroughness across all questions.

Summary

The candidate demonstrated solid understanding of a basic algorithmic problem (pair sum) with correct complexity analysis, but struggled with a common string problem and provided an incomplete solution for parentheses balancing. Overall performance is average, with clear strengths in algorithm explanation but notable gaps in breadth of knowledge and depth of problem solving.
