

Placement Simulator - Interview Report

Role: SDE
Category: dsa
Difficulty: easy

Scores

overall: 70/100
technical: 70/100
communication: 74/100
confidence: 76/100
problemSolving: 70/100
coding: 70/100

Strengths

- Provided a correct and well structured implementation for validating balanced parentheses.
- Demonstrated ability to translate a problem into code with appropriate data structures.

Weaknesses

- Incomplete explanation for cycle detection; omitted the key condition of pointer meeting.
- Did not discuss or implement the hash map approach for finding the first non repeating character.
- Lacked depth in reasoning for the first and third questions.

Suggestions

- When answering algorithmic questions, explicitly state all key conditions and edge cases (e.g., pointer meeting in cycle detection).
- Include the hash map strategy for the non repeating character problem and explain its time/space trade offs.
- Practice articulating the reasoning behind each step to strengthen confidence and clarity.

Summary

The candidate shows solid coding skills for straightforward problems but struggles with deeper algorithmic reasoning and missing key concepts in other questions. Strength lies in clear implementation for balanced parentheses; weaknesses include incomplete explanations for cycle detection and non repeating character problems. Focused practice on algorithmic reasoning and trade off discussions will elevate overall performance.
