

Placement Simulator - Interview Report

Role: SDE

Category: system-design

Difficulty: medium

Scores

overall: 50/100

technical: 55/100

communication: 60/100

confidence: 50/100

problemSolving: 55/100

coding: 0/100

Strengths

- Mentioned chunked uploads for handling large files
- Identified a dead letter queue for failed messages

Weaknesses

- Failed to answer the metrics/logs/traces question
- Architecture description lacks depth (security, scalability, monitoring, retries, back off, idempotency)
- Answers are brief and lack supporting detail or trade off analysis

Suggestions

- Practice structuring answers with a clear problem statement, constraints, trade offs, and a detailed design diagram
- Include key concepts such as authentication, authorization, data consistency, retry strategies, exponential back off, and observability
- Show confidence by speaking decisively and using concrete examples or past experience

Summary

The candidate demonstrates a basic grasp of some system design concepts such as chunked uploads and dead letter queues but lacks depth in architecture, observability, and error handling. Answers are concise but often incomplete, and confidence is low. Strengths include identifying key components, while weaknesses revolve around missing critical details and insufficient explanation. Focused practice on detailed design, trade offs, and confident communication would improve overall performance.
