

Placement Simulator - Interview Report

Role: SDE

Category: dsa

Difficulty: easy

Scores

overall: 75/100

technical: 75/100

communication: 70/100

confidence: 70/100

problemSolving: 70/100

coding: 0/100

Strengths

- Accurately described Floyd's Cycle Detection Algorithm with correct time and space complexity.
- Used a hash map to efficiently find the first non repeating character, demonstrating understanding of $O(1)$ operations.
- Provided clear, concise explanations for both solved problems.

Weaknesses

- Did not answer the parentheses balance question, leaving a critical part of the interview incomplete.
- Missing discussion of edge cases or alternative solutions for the parentheses problem.

Suggestions

- Practice answering all interview questions fully, ensuring you address each part of the prompt.
- For balanced parentheses, implement a stack based solution and discuss its $O(n)$ time and $O(n)$ space trade offs.
- Review common interview patterns to avoid skipping questions.

Summary

The candidate demonstrated solid technical knowledge and clear communication on two of the three questions, correctly applying efficient algorithms and data structures. However, the failure to answer the third question reveals a gap in completeness and preparedness. Overall performance is good but not exceptional; focused practice on fully addressing all interview prompts and reviewing common data structure problems would strengthen their candidacy.
